

ValueMetrics Inventory Optimisation

State-of-the-art Inventory Optimisation Software to ensure that you have the right stock in the right place at the right time.

We use our expertise combined with world-class software to help you scientifically determine the optimal levels of your inventory, providing you with the opportunity to:

- Reduce your inventory between 15 – 50%
- Improved inventory availability 5% and 15%
- Increase your customer service level by as much as 20%
- Reduce operational costs and increase profitability

This solution is designed as a management tool and not a transaction-based system. It is highly adaptable and able to interface with any ERP or in-house systems.

We can provide inventory management solutions that help you to model the inventory requirements of your business, taking into account the unique supply and demand characteristics of your inventory and supply chain.

Based upon demand forecasts, customer orders, supplier lead times, user defined replenishment rules, current stock levels and the existing order pipeline, we provide inventory solutions that will calculate the ideal levels of safety stock for every line item at every level in the supply chain.

Our solution provides a level of intelligence and flexibility that is not available in ERP systems.

As part of our Supply Chain Optimisation services, we include Inventory Optimisation and Inventory Planning solutions that are flexible, simple to use, easy to understand and cover the key elements of Inventory Management:

- Supplier and Lead Time Management
- Stock Profiling and Classifications
- Forecast and Demand Planning
- Inventory Modelling and Strategic Planning
- Excess Stock Management
- Replenishment and Distribution
- Key Performance and Process Monitoring

The benefits of a ValueMetrics Inventory Optimisation Solution are:

- The establishment of realistic investment and availability objectives
- Improved forecasting accuracy
- Improved inventory availability
- Reduced inventory holding
- Reduced lost sales and improved customer satisfaction
- Reduced waste
- Reduced emergency orders and changes to order schedules
- Reduced obsolescence
- Reduced inventory write-offs and write-downs
- Rationalised product range
- Improved staff motivation, productivity and job satisfaction
- Better visibility of inventories
- Uniform inventory management processes across organisations
- A higher degree of automation of the demand to replenishment process
