

ValueMetrics Predictive Simulation

The goal in today's volatile business environment is to increase business agility and the flow of customer value at optimum cost. ValueMetrics' Predictive Simulation solutions enable companies to do this by developing a predictive digital twin of their business model that surface the information they need to improve decision making, de-risk planning and delight customers with new experiences and business models.

Typical solutions delivered through ValueMetrics Predictive Simulation:

- **Predictive Digital Twin**
A predictive simulation model virtualises your business, providing your management team with a smart virtual environment that connects leaders and decision makers with their processes and data for real business insight.
- **Planning and Strategy**
Decision clarity can be achieved through a predictive simulation model of the current business. This allows you to connect with your business processes and data far easier than traditional business analytics, charts and dashboards – leading to clearer insight and foresight of plans on future performance.
- **Business Case Development**
In selling ideas or inspiring change, nothing is more compelling than experiencing data rich visualization of business ideas or plans for gaining stakeholder, investor or customer confidence.
- **New Facility Design**
Design, visualize and experience how new facilities will operate before any ground is broken or investment committed.
- **Risk Management**
Predictive simulation is an ideal technology for quantifying risk and can be employed as part of a risk management strategy for identifying business options with minimal volatility.
- **Supply Chain Optimisation**
Predictive simulation supports supply chain planning through harnessing complexity and managing variability. By visualising the future performance of your supply chain, it enables you to reduce risk, maximise resource allocation and gain agility through greater control of your operations.

■ Sustainability

Predictive simulation can provide the foresight needed to get the right balance of the needs of the present with the potential for future generations to prosper and future proof business decisions for more sustainable, responsible and respectful business outcomes.

Powerful, yet simple tools for effective decision making

Deploying ValueMetrics Predictive Simulation capabilities and model assets will support you in decision making and enable smart business processes in your business that best balance service delivery and cost.

Our Predictive Simulation Software has powerful built-in model building elements so that you can get your models up and running in no time with a wide range of standard modelling elements with unique logic controls, easy configuration and which has open connectivity to common data sources.

Once a predictive model of your business process is created, you can ask 'what-if?' questions by changing the model and simulating scenarios. This allows you to understand the future impact and consequence of business change, without incurring any risk or cost.

Predictive digital twins enable business scenarios to be simulated and outcomes analysed, and compared before you decide on the best course of action. Having secured decision clarity in a virtual world, you can pass optimum decisions for real-world execution.

The use of our Predictive Simulation Software enables the development of smarter business models, facilitating better understanding of complex dynamic processes, improved business data visualisation and insight. This level of management understanding is critical for your business when considering radical transformation options which can incur major business risk.

The benefits of a ValueMetrics Predictive Simulation Solution are:

- Developing a predictive digital twin of your business model provides certainty and foresight of your operational plans to ensure smart decisions are made
- We remove the costs in developing new concepts and risk from greenfield developments
- Simulating your business processes and data provides the insight to achieve the right balance of resources and cost for optimum performance.
- Virtual models simplify co-ordinating developments and managing project communication
- Real time visibility into business processes provides the insight needed for agile business planning
- Simulation provides analysis of existing operations so that costs and performance can be optimised
- A predictive digital twin helps you visualise your business and its data in a way that facilitates understanding, clear communication of ideas and plans and enables collaboration across functional teams

Why ValueMetrics?

ValueMetrics are a team of professionals with significant experience in Performance Management, Supply Chain Optimisation and Process Excellence. We combine our unparalleled knowledge and experience with state-of-the-art software solutions, focusing on the delivery of the most appropriate solutions to our clients. We enable our clients to become Performance Driven Enterprises.
